

# InfinID Technologies V-Tag Active RFID Tags

## Confidence In Tracking

V-Tag™ is a Location Tracking System (LTS) RFID active tag with sensor capabilities that adds the ability for the tags to “talk” to each other rather than communicating through fixed RFID readers and antennas. No more costly requirements to install ethernet cabling, power, mounting brackets and active RFID transponder antennas in multiple locations. Using fixed V-Tags with known locations, you can create fixed locations within your facility, then use mobile V-Tags attached to your high value assets to track their location. The tag-to-tag networking creates an ad hoc wireless network that is robust, reliable and reduces the amount of infrastructure needed for deployment; the hop distance between V-Tag’s™ can be up to 300 feet. The business impact of this breakthrough technology is to manage assets more cost effectively thereby providing bottom line savings to companies and government agencies.
